# Ecological Integrity Monitoring at Parks Canada

Dan Kehler & Eric Tremblay  
Atlantic Service Centre & Kouchibouguac National Park

# A little about Parks Canada

- 125 years of parks, 100 years of Parks Canada
- Parks Canada manages:
  - 140 National Historic Sites (10%)
  - 42 National Parks (3% of Canada)

# Parks Canada Mandate

- *On behalf of the people of Canada, we **protect** and **present** nationally significant examples of Canada's natural and cultural heritage, and foster public understanding, appreciation and enjoyment in ways that ensure the ecological and commemorative integrity of these places for present and future generations.*

## Why monitor?

Monitoring tells us the...

**status** (where are we?)

&

**trend** (where are we going?)

of ...

## What we monitor

- Ecological integrity
- Cultural integrity
- Visitor experience
- Public awareness and understanding

# What drives monitoring at Parks Canada?

## Legislation & policy

- report to parliament every two years

## Management evaluation

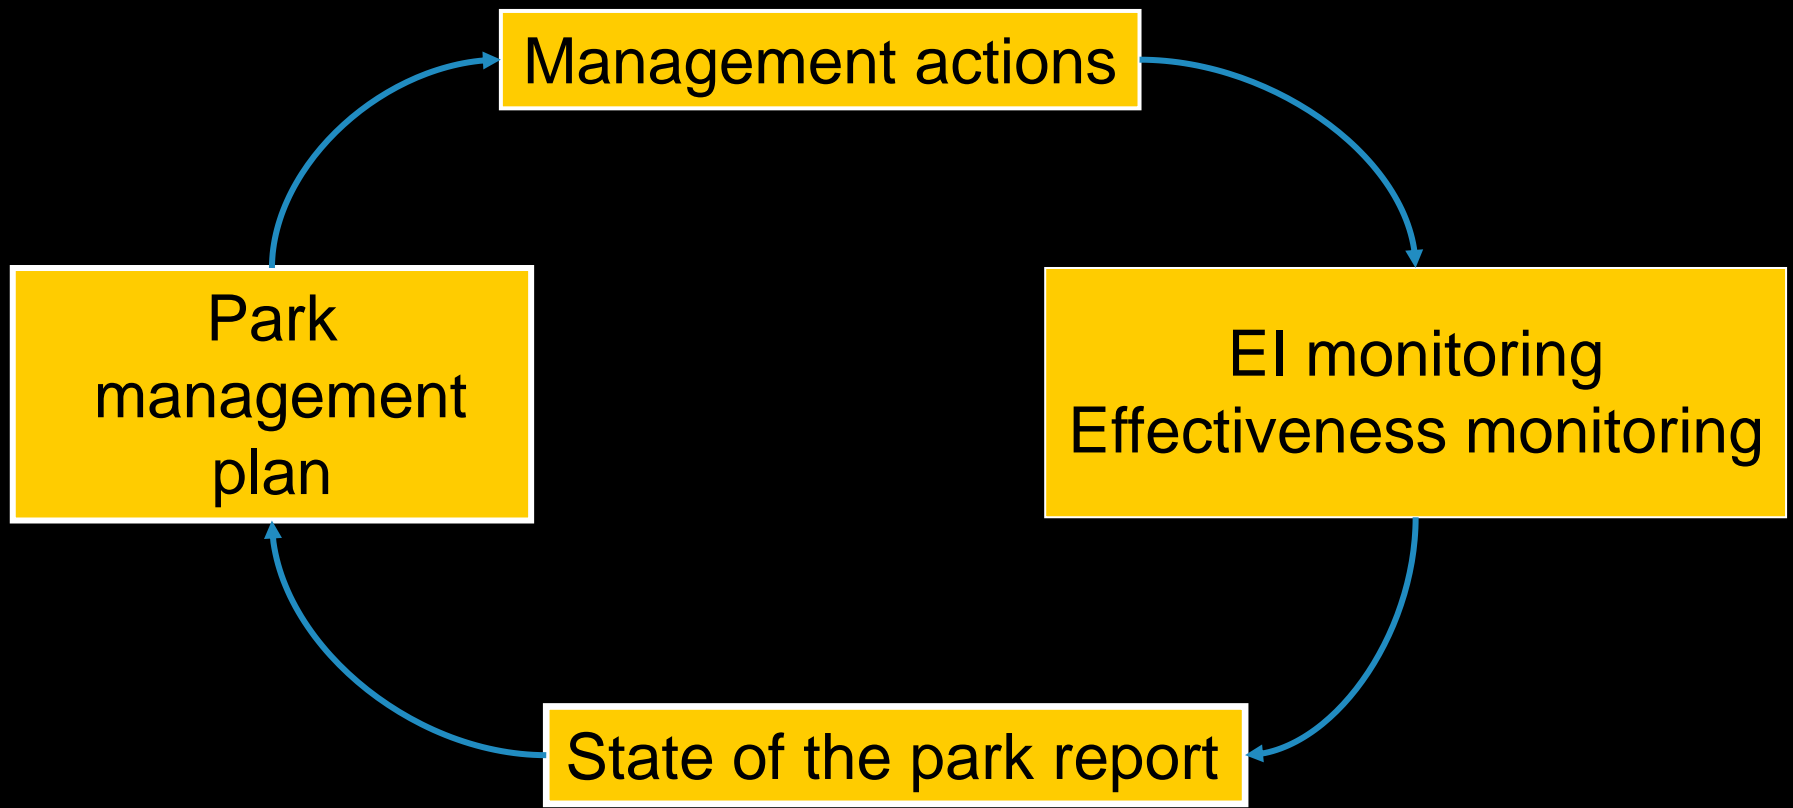

- are our projects effective?

## Moral

- guardians/steward role

# Planning Cycle

# Program Design

## Criteria

- Comprehensive
- Useful
- Sustainable
- Engaging
- Credible

# **Indicators** **ecosystems**

|                |                 |                   |
|----------------|-----------------|-------------------|
| <b>Forests</b> | <b>Wetlands</b> | <b>Freshwater</b> |
| <b>Barrens</b> | <b>Coastal</b>  | <b>Marine</b>     |

# Indicators and assessment ecosystems, colours, arrows

# State of the Park Report – every 5 years

## PACIFIC RIM

NATIONAL PARK RESERVE OF CANADA

*State of the Park Report*

## Cape Breton Highlands

National Park of Canada

State of the Park Report

Penultimate Draft: March 23, 2010

## *State of the Park Report*

KLUANE NATIONAL PARK AND RESERVE OF CANADA

Science environment

Analysis

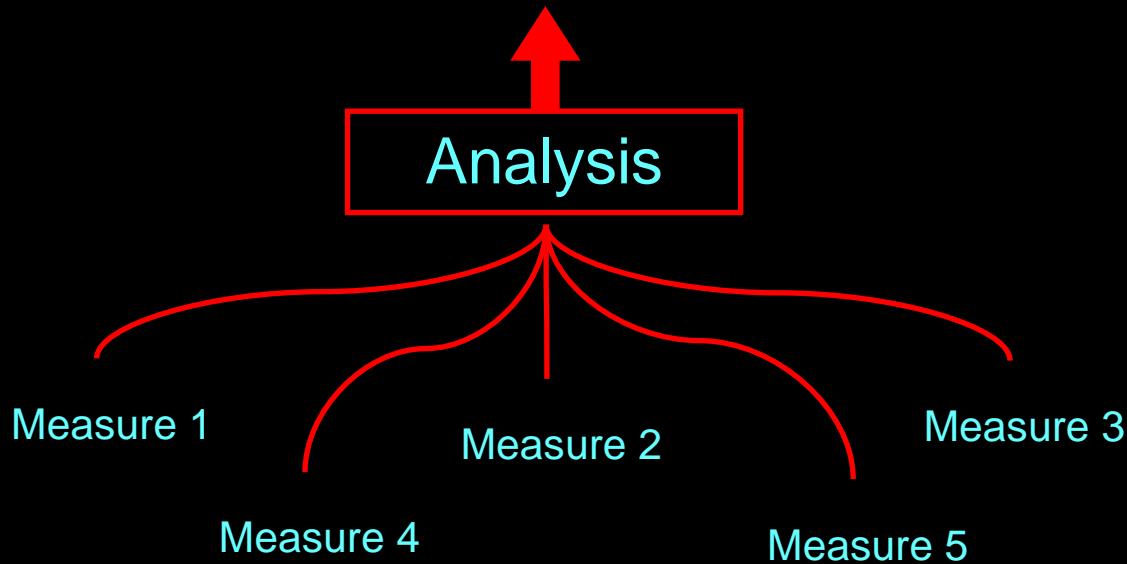

Measure 1

Measure 2

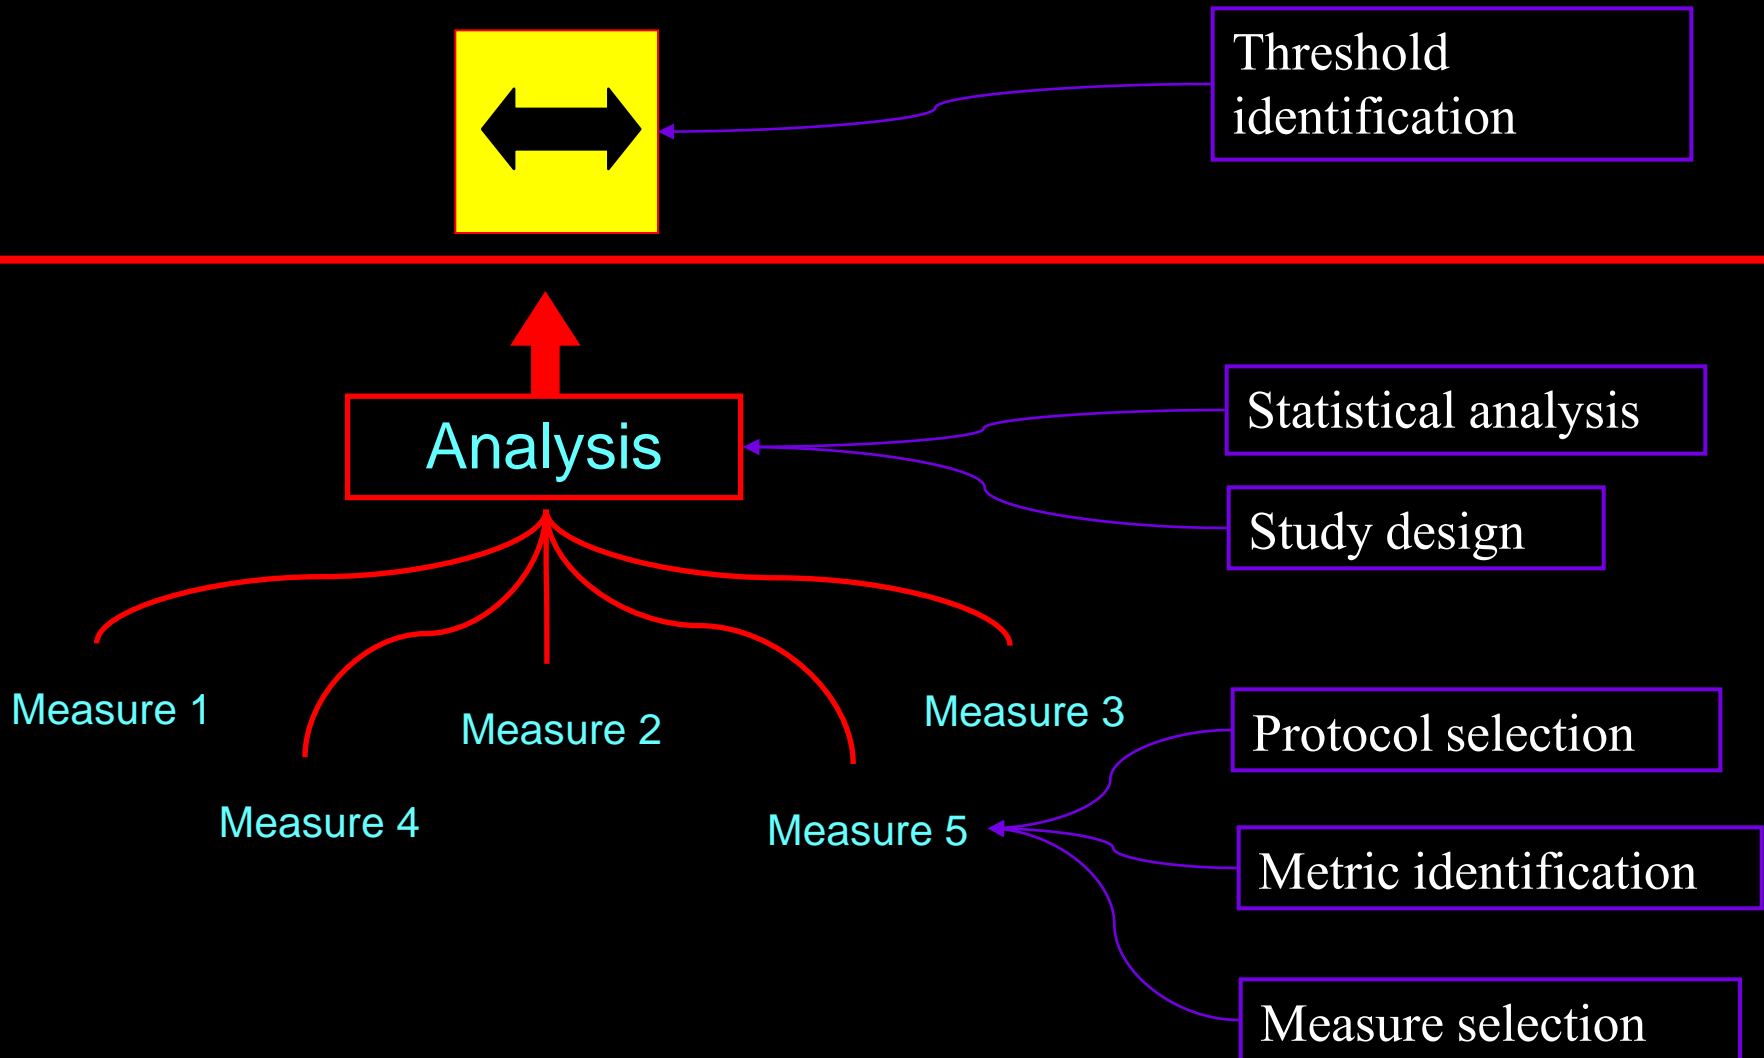

Measure 3

Measure 4

Measure 5

# Developing monitoring

## Measure selection

- Stakeholder consultation
- Conceptual ecosystem models
- Availability of protocols
- Historical data availability
- etc...

## Measure examples in Atlantic NP's

Piping plover

Bank swallows

Greater yellowlegs

Tern

Otter

St. Lawrence aster

Soft-shell clams

Eel grass

Green crab

Saltmarsh vegetation

Intertidal community

Estuarine IBI

Shorefast ice

Coastal erosion

Infrastructure footprint

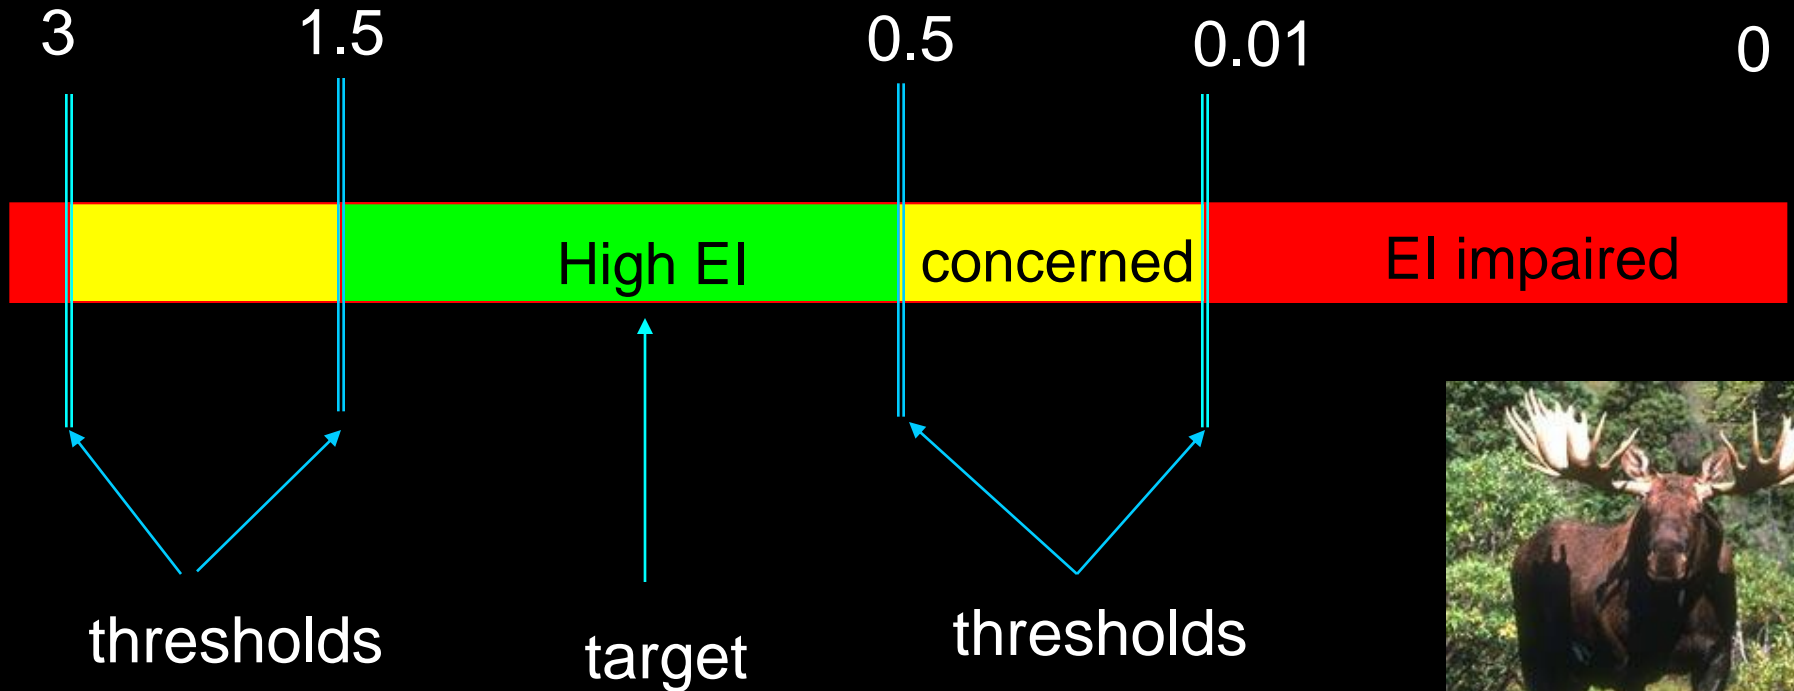

Unauthorized dune trails

Dune movement

Saltmarsh surface area

# Each measure needs interpretation

Moose density (#/km<sup>2</sup>)

# Threshold derivation

Thresholds are points of management concern

- Blend scientific information and human values  
continuum: PVA to common sense.
- Risk management – how serious is being wrong?

Threshold approaches

- Published
- Expert opinion
- Stress gradient
- Natural variability
- Common sense

## Thresholds from published work

Example: Piping plover fledging success.

The recovery team promotes a fledgling success rate of 1.65 fledglings./breeding pair in order to meet ten-year recovery goals.

## Thresholds from expert opinion

### Example: Piping plover adult abundance

Based on expert assessment of habitat, it is expected that  $>10$  pairs could be supported. 10 pairs is the maximum observed in the past 20 years.

# Thresholds from stress gradient

## Example: Lichen index of air purity (IAP)

Provincial database grouped into urban, sub-urban and wilderness sites.

Table 2. Mean Index of Air Purity scores for plots across a gradient of air quality (from unpublished data from Nova Scotia Department of Environment).

| Plot type        | Location                             | n  | Mean IAP | SE    |
|------------------|--------------------------------------|----|----------|-------|
| Urban            | Within 10km of center of major towns | 8  | 0.092    | 0.065 |
| Sub-urban        | 10-25km from major towns             | 11 | 0.510    | 0.09  |
| Wilderness areas | >25km from major towns               | 16 | 0.716    | 0.113 |

Table 3. Thresholds for lichen species richness and Index of air purity at Kejimikujik.

| Measure             | Thresholds |             |        |
|---------------------|------------|-------------|--------|
|                     | Poor       | Fair        | Good   |
| Index of Air Purity | <0.209     | 0.209-0.613 | >0.613 |

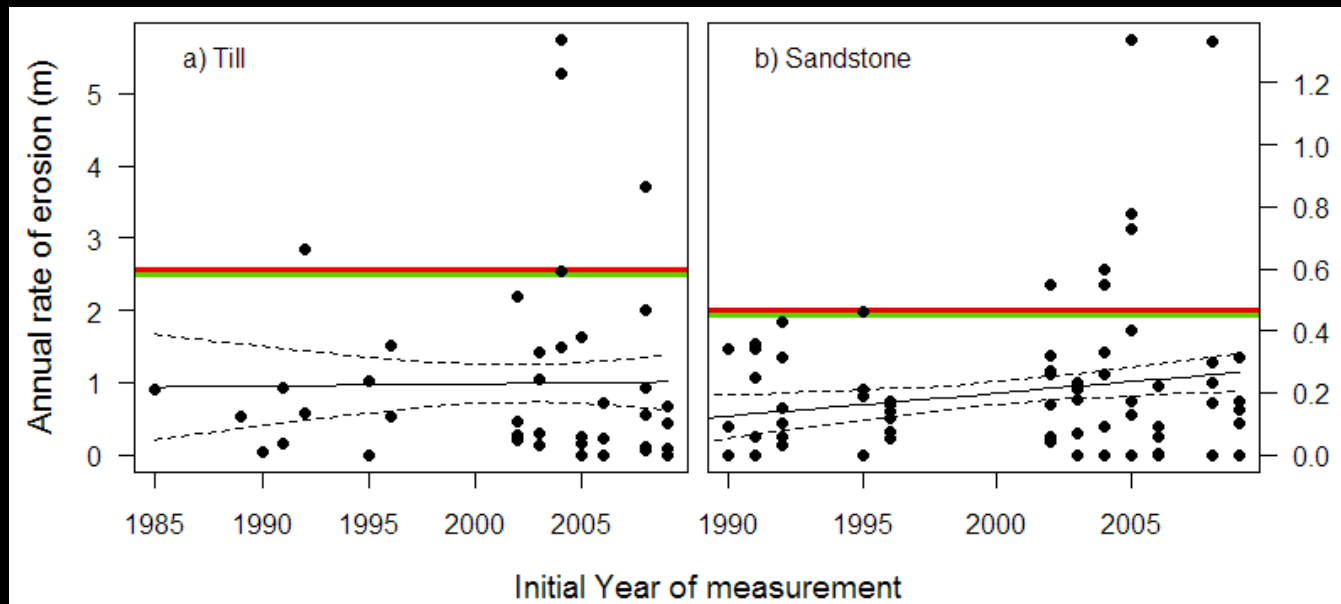

## Thresholds from natural variability

- >80% of thresholds
- What is natural?
- In the absence of a trend, assume current condition is “good”
- If reference data contains a mix of poor and good sites, use the EPA 75/25 rule. (be in the top quartile).

# Thresholds from natural variability

## Example: coastal erosion

- Twenty years of erosion rate data.
- Threshold based on 90<sup>th</sup> percentile (assume that 10% of years represent anomalies)

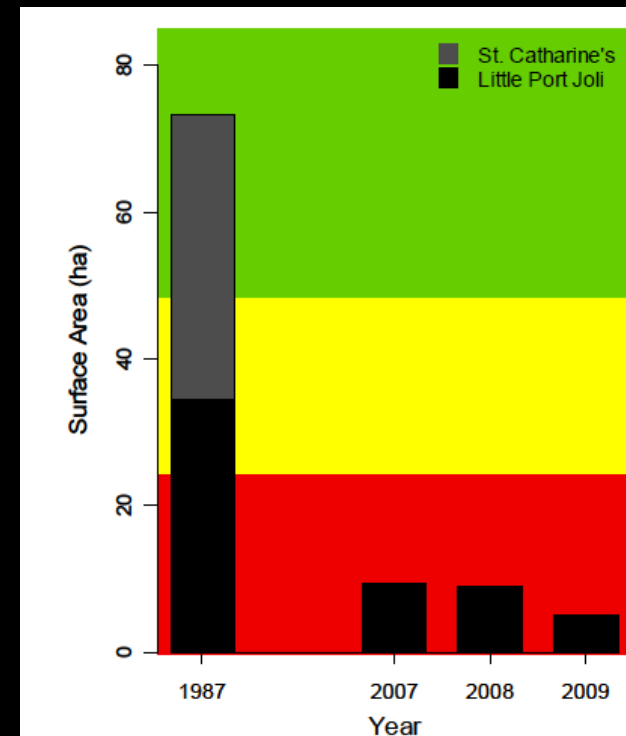

# Thresholds from natural variability

## Example: Eel grass extent

- For Kejimikujik, historical map at the time of park establishment defines “best” condition in hectares.
- What represents the fair and poor condition?  
1/3 rule.

Table 1. Thresholds for eelgrass extent at Kejimikujik.

| Measure         | Thresholds   |   |  |
|-----------------|--|---|--|
|                 | Poor   | Fair  | Good                                       |
| Eelgrass extent | >66% decline in area from baseline reference condition | >33-66% decline in area from baseline reference condition | Within 33% of baseline reference condition |

## Common sense thresholds

Example: # of unauthorized dune trails

- Goal is to have zero, what about fair/poor zones?
- No theory or case studies to use.
- Numbers chosen by group consensus, but appear arbitrary.

# Rolling up sub-measures

Table 1. Thresholds for Piping plover population status at Kejimikujik Seaside.

| Abundance<br>(# breeding pairs) | Productivity<br>(# young fledged/pair) |       |
|---------------------------------|--|-------|
|                                 | ≥1.65                                  | <1.65 |
| ≥10                             | Good                                   | Fair  |
| <10                             | Fair                                   | Poor  |

Table 1. Sub-measures of the Soft-shell clam Population Condition Index.

| Sub-measure                              | Monitoring question  | Score |     |
|--|--|-------|-----|
|  |  | 0     | 1   |
| Density of Juvenile Clams (10-30 mm)     | Is the mean density of juvenile clams ≥ 7.37 clams/m <sup>2</sup> ?    | No    | Yes |
| Density of Young Adult Clams (>30-50 mm) | Is the mean density of young adult clams ≥ 5.32 clams/m <sup>2</sup> ? | No    | Yes |
| Density of Older Adult Clams (>50 mm)    | Is the mean density of older adult clams ≥ 5.63 clams/m <sup>2</sup> ? | No    | Yes |

# Questions?

## **Monitoring challenge:** many expectations

- Park managers
- Science community
- Local stakeholders
- NGOs
- Parliament (broad public)

Each National Park has sought out its own balance of these competing interests

# First hiccups

- What does “comprehensive” really mean?
- How do we monitor something we don’t fully understand?
- Can a small set of measures “represent” an ecosystem?
- How do we select measures?

|  <b>3.2.1 Forest Ecosystem Indicator</b> |   |
|---|---|
| MEASURE   | STATUS  |
| Proportion of Acadian Old Growth Forest   |    |
| Boreal Succession   |    |
| Nocturnal Owls  |    |
| Moose Abundance   |    |
| Moose Recruitment   |    |
| Boreal Forest Connectivity *  |    |
| Old Growth Forest Health  |   |
| Soil Process  |  |
| Forest Salamander Abundance   |  |
| Lichen Index of Air Purity  |  |
