

Kenow Fire Burn Severity

Total size: 350.1 sq. km
 Total size in Park: 193 sq. km
 % of national park burned: 38.6%

Burn Severity refers to the amount of vegetation change between pre-fire and post-fire condition. It is a way of describing the amount of ecological change.

A note on burn severity classes: Class thresholds are not a standard for this area. Burn severity values are therefore estimates only. Small burned or unburned patches (a) may not show.
